

# SR UNIVERSITY

## AI ASSIST CODING

### **Lab-6.4:** *AI-Based Code Completion – Classes, Loops, and Conditionals*

**ROLL NO:**2503A51L17

**NAME:**Simra Tahseen

**BATCH:**24BTCAICS17

#### **Lab Objectives:**

- To explore AI-powered auto-completion features for core Python constructs.
- To analyze how AI suggests logic for class definitions, loops, and conditionals.
- To evaluate the completeness and correctness of code generated by AI assistants.

#### **Lab Outcomes (LOs):**

After completing this lab, students will be able to:

- Use AI tools to generate and complete class definitions and methods.
- Understand and assess AI-suggested loops for iterative tasks.
- Generate conditional statements through prompt-driven suggestions.
- Critically evaluate AI-assisted code for correctness and clarity

#### **TASK #1:**

#### **Prompt Used:**

- Start a Python class named Student with attributes name, roll number, and marks, Prompt GitHub Copilot to complete methods for displaying details and checking if marks are above average.

#### **Code:**

```
class Student:
```

```
    def __init__(self, name, roll_number, marks):
```

```
        self.name = name
```

```
        self.roll_number = roll_number
```

```
        self.marks = marks
```

```
    def display_details(self):
```

```
        print(f"Name: {self.name}, Roll No: {self.roll_number}, Marks: {self.marks}")
```

```
    def is_above_average(self, average=50):
```

```
        if self.marks > average:
```

```
            print(f"{self.name} has marks above average.")
```

```
        else:
```

```
            print(f"{self.name} does not have marks above average.")
```

```
if __name__ == "__main__":

    name = input("Enter student name: ")

    roll_number = int(input("Enter roll number: "))

    marks = float(input("Enter marks: "))

    student = Student(name, roll_number, marks)

    print("\n--- Student Details ---")

    student.display_details()

    avg = float(input("Enter average marks to compare: "))

    student.is_above_average(avg)

class Student:

    def __init__(self, name, roll_number, marks):

        self.name = name

        self.roll_number = roll_number

        self.marks = marks

    def display_details(self):

        print(f"Name: {self.name}, Roll No: {self.roll_number}, Marks: {self.marks}")

    def is_above_average(self, average=50):

        if self.marks > average:

            print(f"{self.name} has marks above average.")

        else:

            print(f"{self.name} does not have marks above average.")

if __name__ == "__main__":

    name = input("Enter student name: ")

    roll_number = int(input("Enter roll number: "))

    marks = float(input("Enter marks: "))

    student = Student(name, roll_number, marks)

    print("\n--- Student Details ---")

    student.display_details()

    avg = float(input("Enter average marks to compare: "))

    student.is_above_average(avg)
```

## Code Generated:

```
meanpy > hello.py ...
1 class Student:
2     def __init__(self, name, roll_number, marks):
3         self.name = name
4         self.roll_number = roll_number
5         self.marks = marks
6
7     def display_details(self):
8         print(f"Name: {self.name}, Roll No: {self.roll_number}, Marks: {self.marks}")
9
10    def is_above_average(self, average=50):
11        if self.marks > average:
12            print(f"{self.name} has marks above average.")
13        else:
14            print(f"{self.name} does not have marks above average.")
15
16
17 if __name__ == "__main__":
18     name = input("Enter student name: ")
19     roll_number = int(input("Enter roll number: "))
20     marks = float(input("Enter marks: "))
21
22     student = Student(name, roll_number, marks)
23
24     print("\n--- Student Details ---")
25     student.display_details()
26
27     avg = float(input("Enter average marks to compare: "))
28     student.is_above_average(avg)
29
30
31
```

## Output After executing Code:

```
PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL PORTS
Enter roll number: 17
Enter marks: 99

--- Student Details ---
Name: simra, Roll No: 17, Marks: 99.0
Enter average marks to compare: 98
simra has marks above average.
PS C:\Users\SANIYA TAHSEEN\OneDrive\Documents\AI_CODING>
```

## Observations:

- A Student class is created with attributes **name**, **roll number**, and **marks**.
- The display\_details() method neatly prints the student's details.
- The is\_above\_average() method compares the student's marks with a given average and prints the result.
- User input is taken for **name**, **roll number**, **marks**, and **average** at runtime, making the program interactive.

## TASK #2:

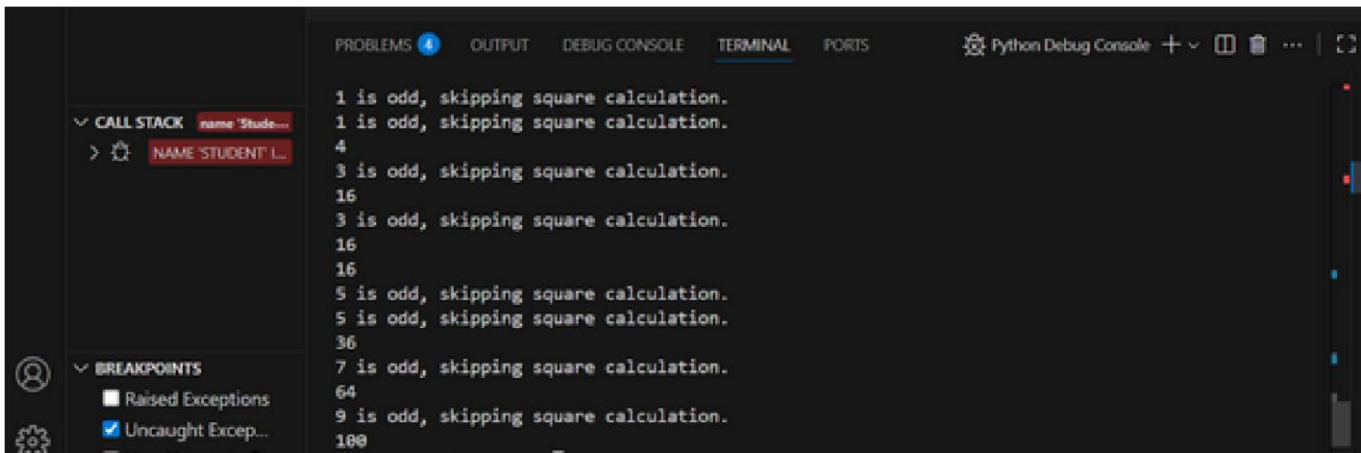

### Prompt Used:

- Write the first two lines of a for loop to iterate through a list of numbers. Suggest how to calculate and print the square of even numbers only.

## Code Generated:

```
1 numbers = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
2
3 for num in numbers:
4     # If the number is even, calculate and print its square
5     if num % 2 == 0:
6         print(num ** 2)
7     else:
8         print(f"{num} is odd, skipping square calculation.")
```

## Output After executing Code:

### Observations:

- The function iterates through numbers.
- We have to give the Condition if  $\text{num} \% 2 == 0$  checks even numbers.
- It results in Prints their square using  $\text{num} ** 2$ .

### TASK#3:

#### Prompt Used:

• Create a class called Bank Account with attributes account holder and balance . Complete methods for deposit() ,withdraw() ,and check for insufficient balance.

#### Code:

```
class BankAccount:
```

```
    def __init__(self, account_holder, balance=0, overdraft_limit=0):
```

```
        self.account_holder = account_holder
```

```
        self.balance = balance
```

```
        self.overdraft_limit = overdraft_limit
```

```
    def deposit(self, amount):
```

```
        if amount > 0:
```

```
            self.balance += amount
```

```
            print(f"Deposited {amount}. New balance: {self.balance}")
```

```
        else:
```

```
            print("Deposit amount must be positive.")
```

```
    def withdraw(self, amount):
```

```
        if amount <= 0:
```

```
            print("Withdrawal amount must be positive.")
```

```
        elif self.balance - amount < -self.overdraft_limit:
```

```
            print("Overdraft limit reached! Withdrawal denied.")
```

```
        else:
```

```
            self.balance -= amount
```

```
            print(f"Withdrew {amount}. New balance: {self.balance}")
```

```
    def check_balance(self):
```

```

print(f"Account Holder: {self.account_holder}, Balance: {self.balance}")

account = BankAccount("ziva", 1000, overdraft_limit=500)

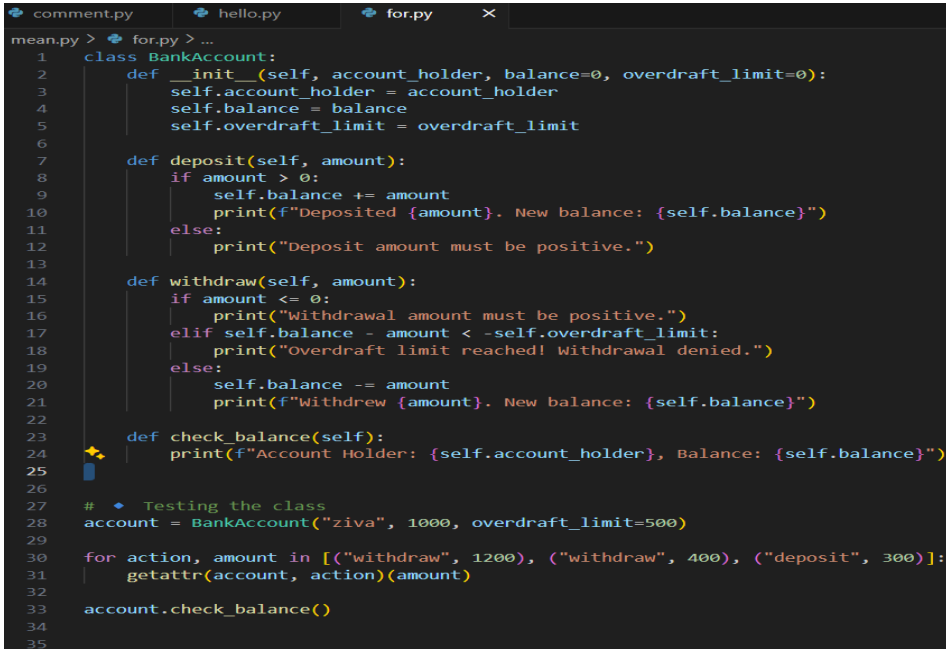

for action, amount in [("withdraw", 1200), ("withdraw", 400), ("deposit", 300)]:

    getattr(account, action)(amount)

account.check_balance()

```

### Code Generated:

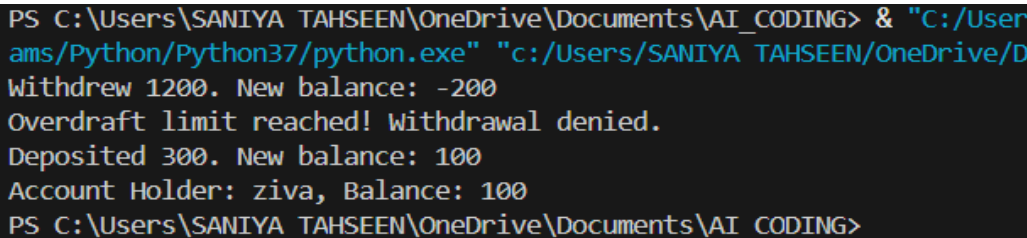

```

comment.py  hello.py  for.py  X
mean.py > for.py > ...
1  class BankAccount:
2      def __init__(self, account_holder, balance=0, overdraft_limit=0):
3          self.account_holder = account_holder
4          self.balance = balance
5          self.overdraft_limit = overdraft_limit
6
7      def deposit(self, amount):
8          if amount > 0:
9              self.balance += amount
10             print(f"Deposited {amount}. New balance: {self.balance}")
11         else:
12             print("Deposit amount must be positive.")
13
14         def withdraw(self, amount):
15             if amount <= 0:
16                 print("Withdrawal amount must be positive.")
17             elif self.balance - amount < -self.overdraft_limit:
18                 print("Overdraft limit reached! Withdrawal denied.")
19             else:
20                 self.balance -= amount
21                 print(f"Withdrew {amount}. New balance: {self.balance}")
22
23         def check_balance(self):
24             print(f"Account Holder: {self.account_holder}, Balance: {self.balance}")
25
26
27 # ♦ Testing the class
28 account = BankAccount("ziva", 1000, overdraft_limit=500)
29
30 for action, amount in [("withdraw", 1200), ("withdraw", 400), ("deposit", 300)]:
31     getattr(account, action)(amount)
32
33 account.check_balance()
34
35

```

### Output After executing Code:

```

PS C:\Users\SANIYA TAHSEEN\OneDrive\Documents\AI_CODING> & "C:/Users/SANIYA TAHSEEN/OneDrive/Documents/AI_CODING/Python/Python37/python.exe" "c:/Users/SANIYA TAHSEEN/OneDrive/Documents/AI_CODING/Python/Python37/python.exe"
Withdrew 1200. New balance: -200
Overdraft limit reached! withdrawal denied.
Deposited 300. New balance: 100
Account Holder: ziva, Balance: 100
PS C:\Users\SANIYA TAHSEEN\OneDrive\Documents\AI_CODING>

```

### Observation:

- We used function deposit(): increases balance.
- we can able to use the function withdraw(): prevents overdrawing using if conditions . its
- results in check\_balance(): shows current balance\_

### TASK#4:

#### Prompt Used:

- Define a list of student dictionaries with keys name and score. Write a while loop to print the names of students who scored more than 75.

### Code:

```
students = [("Pari", 80), ("Sam", 70), ("Katrina", 90), ("David", 60)]

i = 0

while i < len(students):

    name, score = students[i]

    if score > 75:

        print(name)

    i += 1
```

### Code Generated:

A screenshot of a code editor with a dark theme. The editor has several tabs at the top: 'comment.py', 'hello.py', 'for.py', and 'stud.py' (which is active). The code in the 'stud.py' tab is as follows:

```
mean.py > stud.py > ...
1  students = [("Pari", 80), ("Sam", 70), ("Katrina", 90), ("David", 60)]
2  i = 0
3  while i < len(students):
4      name, score = students[i]
5      if score > 75:
6          print(name)
7      i += 1
```

### Output After executing Code:

A screenshot of a terminal window with a dark background. The prompt is 'PS C:\Users\SANIYA TAHSEEN\OneDrive\Documents\AI\_CO'. The command executed is 'ams/Python/Python37/python.exe "c:/Users/SANIYA TA'. The output of the program is:

```
Pari
Katrina
PS C:\Users\SANIYA TAHSEEN\OneDrive\Documents\AI_CO
```

### Observations:

- We Uses while loop with counter i.
- The loop Checks if score > 75.
- It will Prints qualifying students.

### TASK#5:

#### PROMPT:

- Begin writing a class Shopping Cart with an empty items list. Prompt Copilot to generate methods to add\_item , remove\_item , and use a loop to calculate the total bill using conditional discounts.

### Code:

```
lass ShoppingCart:

    def __init__(self):

        self.items = []

def add_item(self, name, price):

    self.items.append((name, price))
```

```

        print(f"added {name} to the cart")

def remove_item(self, name):

    initial_len = len(self.items)

    self.items = [item for item in self.items if item[0] != name]

    if len(self.items) < initial_len:

        print(f"removed shoes from the cart{name}")

    else:

        print(f"{name} not found in the cart")

def calculate_total(self, discount=0):

    total = sum(price for _, price in self.items)

    if discount > 0:

        total -= total * (discount / 100)

    return total

# Example usage:

cart = ShoppingCart()

cart.add_item("shoes", 700)

cart.add_item("shirt", 400)

cart.remove_item("shoes")

cart.remove_item("salwar")

print("Total bill (with 10% discount):", cart.calculate_total(discount=10))

```

## Code Generated:

```

shop.py > shop.py > ...
class ShoppingCart:
    def __init__(self):
        self.items = []

    def add_item(self, name, price):
        self.items.append((name, price))
        print(f"added {name} to the cart")

    def remove_item(self, name):
        initial_len = len(self.items)
        self.items = [item for item in self.items if item[0] != name]
        if len(self.items) < initial_len:
            print(f"removed shoes from the cart{name}")
        else:
            print(f"{name} not found in the cart")

    def calculate_total(self, discount=0):
        total = sum(price for _, price in self.items)
        if discount > 0:
            total -= total * (discount / 100)
        return total

# Example usage:
cart = ShoppingCart()
cart.add_item("shoes", 700)
cart.add_item("shirt", 400)
cart.remove_item("shoes")
cart.remove_item("salwar")
print("Total bill (with 10% discount):", cart.calculate_total(discount=10))

```

## Output After executing Code:

```
PROBLEMS  OUTPUT  DEBUG CONSOLE  TERMINAL
added shirt to the cart
removed shoes from the cartshoes
salwar not found in the cart
removed shoes from the cartshoes
salwar not found in the cart
salwar not found in the cart
Total bill (with 10% discount): 360.0
```

### Observations:

- If we want to add item use function-add\_item(): adds item to cart.
- If we want to remove item use function remove\_item(): removes by name.
- If we want to calculate the total use function calculate\_total(): loops through cart, applies discounts with if-elif.
